

The protection of our environment

is our central concern and an essential contribution to the success of Euroclima.

In cooperation with our employees, neighbours, customers, suppliers and all other stakeholders we include all aspects of environmental protection, sustainable use of resources and preventive measures in all fields of activities.

We work in accordance with the following principles:

Our company is located in an intact environment.

Through our sustainable actions, we make an important contribution, to ensuring that future generations will have the same living conditions, as we have today.

We have established an environmental management system in our companies EUROCLIMA AG Brunico and EUROCLIMA Ges.m.b.H Sillian.

We are committed to adapting the environmental management system to ever changing conditions and continuously reviewing and improving it.

The Euroclima management verifies the relevance, implementation, efficiency and compliance of the environment policy targets. For this verification we consider all internal and external influencing factors on the company.

We analyse all environmental aspects, their causes, their consequences and improve them.

We are committed to protecting and respecting human rights along the entire supply chain.

In consultation with customers, employees, suppliers and the society, we comply with and continuously improve the health, safety and environmental standards.

Our employees' sense of responsibility for the environment is promoted by training and leading by example.

The economical use of resources is important for us.

One main focus is the waste avoidance and separation.

It is possible to dismantle our products completely and easy to the recyclable primary materials.

We produce a big amount of our energy demand with our photovoltaic power plants, solar collectors and our water-to-water heat pump.

Our Air Handling Units, that include heat- and refrigeration recovery systems, help our customers to reduce their energy requirements.

As one of the technology leader in our industry, we offer all major recovery systems in our product range.

The focus of our development activities lies on developing new units and improving existing ones, as environmentally-friendly and energy-efficient as possible.

Our environmental performances are presented transparently.

We consider the compliance with all binding commitments.

With the implementation of the environmental management system in accordance with ISO14001, we ensure additional activities.

Resources for all these activities are provided.
